Zero-Voltage-Transition Boost Converter

Advantages:

- ☺ ZVS achieved for Q_1 and D_1 under any load over the line range;
- ☺ The voltage stress and current stress of Q_1 and D_1 are the same as the basic converter;
- ☺ Q_a is zero-current turn-on;
- ☺ The work time of the auxiliary circuit is very short, so the rms current is very small;
- ☺ PWM controlled.

Disadvantages:

- ☹ Hard turn-off for Q_a , the turn-off loss is higher than the basic converter.
